Write an automation script (Ansible, CloudFormation, Terraform, etc) to deploy a highly available web tier consisting of EC2 instances running Apache or Nginx web server hosting sample Wordpress application. This application should connect to an RDS database.

Goal of the task is:
1.   Provide automation script with the instructions on how to deploy the solution on our own AWS account.
2.   Provide the AWS diagram that shows how the infrastructure is designed.

Once you receive the task please send us your estimation on how much time it will take you to finish and by which day/date.

!!! Please note that we don't expect you to have any financial costs in order to finish this task.
